

11-15-12

TO: CERP-CEPP planning team

From: L Jack Moller,

Please include this statement and facts as a part of the official record for the CERP-CEPP meeting held on 11/19/2012 and include the picture that is a part of this statement.

To help with better identification of the area of WCA3N that is to have water managed so that the saw grass is major vegetation type to survive CEPR water management goals I have created the following map from Google Earth. The area north of the red line should be considered saw grass parries with the area west of the orange line being the strongest or healthiest saw grass prairie habitat. The area north of the red line was never ridge and slough, see federal map below. Consider the area west of the orange line as being a transition zone between the deeper water in the ridge and slough area to the west of the Miami River and the historical saw grass prairie. This is strictly my personal opinion and I look forward to other folks thoughts on this topic. Jack Moller
